## SLUMP OF HYDRAULIC CEMENT CONCRETE FOP FOR AASHTO T 119

## Scope

This procedure provides instructions for determining the slump of hydraulic cement concrete in accordance with AASHTO T 119-23. It is not applicable to non-plastic and non-cohesive concrete.

**Warning**—Fresh Hydraulic cementitious mixtures are caustic and may cause chemical burns to skin and tissue upon prolonged exposure.

### **Apparatus**

- Mold: conforming to AASHTO T 119
  - Metal: a metal frustum of a cone provided with foot pieces and handles. The mold must be constructed without a seam. The interior of the mold shall be relatively smooth and free from projections such as protruding rivets. The mold shall be free from dents, deformations, and adhered mortar. A mold that clamps to a rigid nonabsorbent base plate is acceptable provided the clamping arrangement is such that it can be fully released without movement of the mold.
  - Non-metal: see AASHTO T 119, Section 5.1.2.
- Tamping rod: 16 mm (5/8 in.) diameter and 400 mm (16 in.) to 600 mm (24 in.) long, having a hemispherical tip the same diameter as the rod. (Hemispherical means "half a sphere"; the tip is rounded like half of a ball.)
- Scoop: a receptacle of appropriate size so that each representative increment of the concrete sample can be placed in the container without spillage.
- Tape measure or ruler with at least 5 mm or 1/8 in. graduations
- Base: flat, rigid, non-absorbent moistened surface on which to set the slump mold

#### Procedure

 Obtain the sample in accordance with the FOP for WAQTC TM 2. If the concrete mixture contains aggregate retained on the 37.5mm (1<sup>1</sup>/<sub>2</sub> in.) sieve, remove the aggregate by sieving the concrete sample over a 37.5 mm (1<sup>1</sup>/<sub>2</sub> in.) sieve in accordance with the Wet Sieving portion of the FOP for WAQTC TM 2.

Begin testing within five minutes of obtaining the sample.

- 2. Dampen the inside of the mold and place it on a dampened, rigid, nonabsorbent surface that is level and firm.
- 3. Stand on both foot pieces to hold the mold firmly in place.
- 4. Use the scoop to fill the mold 1/3 full by volume, to a depth of approximately 67 mm (2 5/8 in.).
- 5. Consolidate the layer with 25 strokes of the tamping rod, using the rounded end. Rod the bottom layer throughout its depth. Distribute the strokes evenly over the entire cross section of the concrete.

#### CONCRETE

WAQTC

For the bottom layer, incline the rod slightly and make approximately half the strokes near the perimeter, and then progress with vertical strokes, spiraling toward the center.

- 6. Use the scoop to fill the mold 2/3 full by volume, to a depth of approximately 155 mm (6 1/8 in.).
- 7. Consolidate this layer with 25 strokes of the tamping rod, penetrate approximately 25 mm (1 in.) into the bottom layer. Distribute the strokes evenly.
- 8. Use the scoop to fill the mold to overflowing.
- 9. Consolidate this layer with 25 strokes of the tamping rod, penetrate approximately 25 mm (1 in.) into the second layer. Distribute the strokes evenly. If the concrete falls below the top of the mold, stop, add more concrete, and continue rodding for a total of 25 strokes. Always keep an excess of concrete above the top of the mold. Distribute strokes evenly.
- 10. Strike off the top surface of concrete with a screeding and rolling motion of the tamping rod.
- 11. Clean overflow concrete away from the base of the mold.
- 12. Remove the mold from the concrete by raising it carefully in a vertical direction. Raise the mold 300 mm (12 in.) in  $5 \pm 2$  seconds by a steady upward lift with no lateral or torsional (twisting) motion being imparted to the concrete.

Complete the entire operation from the start of the filling through removal of the mold without interruption within an elapsed time of 2 1/2 minutes.

- 13. Immediately measure the slump:
  - a. Invert the slump mold and set it next to the specimen.
  - b. Lay the tamping rod across the mold so that it is over the test specimen.
  - c. Measure the distance between the bottom of the rod and the displaced original center of the top of the specimen to the nearest 5 mm (1/4 in.).
  - d. If a decided falling away or shearing off of concrete from one side or portion of the mass occurs, disregard the test and perform a new test on another portion of the sample.
- *Note 1:* If two consecutive tests on a sample of concrete show a falling away or shearing off of a portion of the concrete from the mass of the specimen, the concrete probably lacks the plasticity and cohesiveness necessary for the slump test to be applicable.

14. Discard the tested sample.

## Report

- Results on forms approved by the agency
- Sample ID
- Slump to the nearest 5 mm (1/4 in.).

## PERFORMANCE EXAM CHECKLIST

# SLUMP OF HYDRAULIC CEMENT CONCRETE FOP FOR AASHTO T 119

Par	rticipant Name H	Exam Date		
Re	cord the symbols "P" for passing or "F" for failing on eac	h step of the checklist.		
Procedure Element		Trial 1	Trial 2	
Fir	rst layer			
1.	Mold and floor or base plate dampened?			
2.	Mold held firmly against the base by standing on the t pieces? Mold not allowed to move in any way during	wo foot filling?		
3.	Representative sample scooped into the mold?			
4.	Mold approximately one third (by volume), 67 mm (2	5/8 in.) deep?		
5.	Layer rodded throughout its depth 25 times with hemi end of rod, uniformly distributing strokes?	spherical		
Se	cond layer			
6.	Representative samples scooped into the mold?			
7.	Mold filled approximately two thirds (by volume), 15	5 mm (6 1/8 in.), deep?		
8.	Layer rodded throughout its depth 25 times with hemi uniformly distributing strokes, penetrate approximatel the bottom layer?	spherical end of rod, y 25 mm (1 in.) into		
Th	ird layer			
9.	Representative sample scooped into the mold?			
10.	. Mold filled to just over the top of the mold?			
11.	. Layer rodded throughout its depth 25 times with hemi rod, uniformly distributing strokes, penetrate approxir into the second layer?	spherical end of nately 25 mm (1 in.)		
12.	. Excess concrete kept above the mold at all times while	e rodding?		
13.	. Concrete struck off level with top of mold using tamp	ing rod?		

# OVER

#### T 119

CONCRETE

Procedure Element	Trial 1 Trial 2
14. Concrete removed from around the outside bottom of the mold?	
15. Mold lifted upward 300 mm (12 in.) in one smooth motion, without a lateral or twisting motion of the mold, in $5 \pm 2$ seconds?	
16. Test performed from start of filling through removal of the mold within 2 1/2 minutes?	
17. Slump immediately measured to the nearest 5 mm ( $1/4$ in.) from the top o the mold to the displaced original center of the top surface of the specime	n?
